Type density

LNRE models

Zipf-Mandelbrot as LNRE model

The problem

Type distribution

Zipf-Mandelbrot

The ZM & fZM

LNRE models

Wrapping up

- ▶ What we have just calculated is a **binomial expectation**, i.e. the average over samples of the same fixed size N
 - ▶ arguably, statistically most appropriate

Binomial sampling vs. Poisson sampling

LNRE models

Baroni & Evert

Computing expectations

Expectation = sample average

Poisson sampling
Plugging in ZM

LNRE models

Pooling types
Type density
LNRE models

Zipf-Mandelbrot as LNRE model

The problem
Type distribution
Zipf-Mandelbrot
The ZM & fZM
LNRE models

Wrapping up

- ▶ What we have just calculated is a **binomial expectation**, i.e. the average over samples of the same fixed size N
 - ▶ arguably, statistically most appropriate
- ▶ But mathematically simpler to use **Poisson expectation**:

$$E[V_m(N)] = \sum_k \frac{(N\pi_k)^m}{m!} e^{-N\pi_k}$$

- ▶ here, we sum over samples of various sizes close to N

Binomial sampling vs. Poisson sampling

LNRE models

Baroni & Evert

Switch to Poisson sampling can be motivated in two ways:

Computing expectations

Expectation = sample average

Poisson sampling

Plugging in ZM

Zipf-Mandelbrot as LNRE model

The problem
Type distribution
Zipf-Mandelbrot
The ZM & fZM
LNRE models

Wrapping up

Switch to Poisson sampling can be motivated in two ways:

► **Philosophical:**

- Not as unreasonable as it seems: think of the frequency distribution of nouns in text sample of 1 million running words (such as the Brown corpus) → sample size N (= number of noun tokens) will be different for each sample

Binomial sampling vs. Poisson sampling

LNRE models

Wrapping up

Switch to Poisson sampling can be motivated in two ways:

▶ **Philosophical:**

- ▶ Not as unreasonable as it seems: think of the frequency distribution of nouns in text sample of 1 million running words (such as the Brown corpus) → sample size N (= number of noun tokens) will be different for each sample

▶ **Practical:**

- ▶ When N is large and π small (as with word frequency distributions), Poisson probabilities are a very good approximation to binomial probabilities
- ▶ In lexical statistics, word frequency distribution models almost always use Poisson expectations

Poisson expectations for V_m and V

LNRE models

Baroni & Evert

$$E[V_m(N)] = \sum_k \frac{(N\pi_k)^m}{m!} \cdot e^{-N\pi_k}$$

Computing expectations

Expectation = sample average

Poisson sampling
Plugging in ZM

$$E[V(N)] = \sum_k (1 - e^{-N\pi_k})$$

LNRE models

Pooling types

Type density
LNRE models

- ▶ $E[V]$ sums over probabilities that w_k occurs at least once

Zipf-Mandelbrot as LNRE model

The problem

Type distribution

Zipf-Mandelbrot

The ZM & fZM

LNRE models

Wrapping up

Poisson expectations for V_m and V

LNRE models

Baroni & Evert

$$E[V_m(N)] = \sum_k \frac{(N\pi_k)^m}{m!} \cdot e^{-N\pi_k}$$

$$E[V(N)] = \sum_k (1 - e^{-N\pi_k})$$
